## The Need for Farmworker Housing in Florida

## EXECUTIVE SUMMARY

## Farmworker Population and Household Estimates

An estimated 117,981 farmworkers work in crop agriculture in Florida over the course of one year. These include greenhouse and nursery workers as well as field crop workers. ${ }^{1}$

Farmworkers may be migrant or seasonal. The National Agricultural Workers Survey (NAWS) defines a "migrant" as a person traveling more than 75 miles to find farm work. Seasonal workers also perform labor in crop agriculture but do not make this migration. Of the workers, 46 percent, or 54,271, are estimated to be migrant workers, and 54 percent, or 63,710 , are estimated to be seasonal workers. This marks a change from the 2001 and 2004 rental market studies, which found that the majority of farmworkers were migrants.

Farmworkers may be classified as accompanied or unaccompanied. Accompanied farmworkers are those living with a spouse, children, or parents, or minor farmworkers living with a sibling. An estimated 13 percent of migrant farmworkers and 53 percent of seasonal farmworkers in Florida are accompanied. The average household size is 3.07 members for accompanied migrant workers and 3.71 members for accompanied seasonal workers. Households may contain more than one farmworker; an average of 1.82 farmworkers live in each household containing accompanied migrant workers and an average of 1.39 farmworkers live in each household containing accompanied seasonal workers. Therefore, Florida has a total of 105,328 farmworker households with 179,185 household members:

|  | Unaccompanied <br> Worker <br> Households | Accompanied <br> Worker <br> Households | Total <br> Households | Unaccompanied <br> Worker <br> Household <br> Members | Accompanied <br> Worker Household <br> Members | Total <br> Household <br> Members |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Migrant | 47,216 | 3,877 | 51,092 | 47,216 | 11,901 | 59,117 |
| Seasonal | 29,944 | 24,292 | 54,236 | 29,944 | 90,124 | 120,068 |
| TOTAL | 77,159 | 28,169 | 105,328 | 77,159 | 102,025 | 179,185 |

Sources: United States Bureau of Labor Statistics, Quarterly Census of Employment and Wages, 2005 and United States Department of Labor, National Agricultural Workers Survey, 2003-2006.

This analysis estimates the number of farmworkers and farmworker households by Florida county based on wage data from the Bureau of Labor Statistics. The following 13 counties have the largest farmworker populations: Hillsborough, Miami-Dade, Palm Beach, Collier, Manatee, Orange, Hendry, Volusia, Indian River, Gadsden, Lake, Polk, and De Soto. These counties combined contain 81 percent of the state's farmworkers.

[^0]
## Incomes and Affordable Rent Ranges for Farmworker Households

Unaccompanied migrant farmworkers fall most frequently into the lowest income groups, with 77 percent earning less than $\$ 10,000$ per year. Unaccompanied seasonal workers have somewhat higher incomes, with 75 percent earning \$10,000-25,000 per year and an additional nine percent earning more than $\$ 25,000$ per year. Therefore, about half of unaccompanied farmworkers need single-person units or beds with rents below $\$ 333$ per month, with an additional 25 percent in need of units with rents below $\$ 500$ per month.

Accompanied farmworker households show more variation in their incomes. Accompanied migrant worker households generally have lower incomes than accompanied seasonal worker households, with 26 percent earning less than $\$ 10,000$ per year, 58 percent earning $\$ 10,000-25,0000$ per year, and only 15 percent earning $\$ 25,000$ per year or more. Among accompanied seasonal worker households, only 7 percent earn less than $\$ 10,000$ per year, 54 percent earn $\$ 10,000-25,000$ per year, and 38 percent earn $\$ 25,000$ per year or more. Note that due to data limitations, this likely underestimates the number of accompanied worker households in the lowest income ranges and overestimates the number of households in the highest income ranges.

Many accompanied farmworker families also need housing units with rents well below the market rate, with more than one-third requiring units with rents of $\$ 500$ per month or less. However, half of accompanied farmworker families may be able to afford rents closer to market rates; i.e., in the $\$ 668$ and above range.

## Farmworker Housing Supply

While farmworkers may find a variety of types of housing arrangements, two types of government-licensed or subsidized housing are reserved specifically for farmworkers:

- Multifamily developments with funding from the U.S. Department of Agriculture Rural Development (RD) Section 514 and 516 programs, from Florida Housingallocated SAIL, HOME, and tax credit resources, or both. Presently, there are 6,401 farmworker units with these types of financing in operation or under development.
- Florida Department of Health (DOH) permitted camps for unaccompanied workers. The current capacity of permitted camps is approximately 30,164 beds. Of these, 2,573 beds are located in RD or Florida Housing multifamily developments. Therefore, the DOH camps add 27,591 unduplicated beds to the supply.

Assuming that the Section 514/516 units and Florida Housing-assisted units can house an average of four persons, the farmworker housing supply can house a total of 53,195 farmworkers and their family members in Florida.

The 11 counties with the capacity to house 1,000 or more farmworkers are Collier, Palm Beach, Miami-Dade, Hillsborough, Hendry, De Soto, Manatee, Polk, Indian River, Highlands, and Gadsden. These counties contain 84 percent of the state's farmworker housing capacity.

All but one of these counties also appear in the list of the 13 counties with the most farmworkers. Therefore, while there is a substantial need for farmworker housing, the supply that does exist is largely concentrated in the areas with the most farmworkers.

## Need Estimate: Comparison of Supply and Farmworker Households

The total statewide gap between farmworker housing capacity and the number of farmworkers and their household members is 125,989 . The total gap between the number of single worker beds needed and the number of unaccompanied farmworkers is 49,568 beds. Eleven counties have an unmet need for single worker housing exceeding 1,000 beds: MiamiDade, Hillsborough, Palm Beach, Orange, Manatee, Volusia, Gadsden, Hendry, Indian River, Lake, and Lee. The total gap between the number of multifamily units and the number of accompanied farmworker households is 21,768 units. The seven counties with unmet need for multifamily farmworker units exceeding 1,000 units are Hillsborough, Palm Beach, MiamiDade, Manatee, Orange, Collier, and Hendry.

## The Need for Farmworker Housing in Florida

## INTRODUCTION

This section of the housing needs assessment discusses the need for rental housing for migrant and seasonal farmworkers in Florida’s counties. Farmworkers may or may not be accompanied by immediate family members, and unaccompanied farmworkers have different housing needs and incomes than accompanied farmworkers. Therefore, this analysis examines the number of accompanied and unaccompanied farmworker households, the incomes of each group, and the number of housing units appropriate to each group.

This analysis is divided into six sections:
I. Methodology
II. Farmworker Population and Household Estimates
III. Incomes and Affordable Rent Ranges for Farmworker Households
IV. Farmworker Housing Supply
V. Need Estimate: Comparison of Supply and Households
VI. Data Limitations

## I. METHODOLOGY

## Demand

## Estimating Farmworkers for State and Counties

The total numbers of farmworkers in the state and in each county are derived from two sources: the Bureau of Labor Statistics' Quarterly Census of Employment and Wages (QCEW) and the Department of Labor's National Agricultural Workers Survey (NAWS).

- QCEW: The QCEW "produces a comprehensive tabulation of employment and wage information for workers covered by State unemployment insurance (UI) laws" by industry, including total annual wages and average weekly wages. ${ }^{2}$ The QCEW records information for each "establishment," defined as "the physical location of a certain economic activity--for example, a factory, mine, store, or office. A single establishment generally produces a single good or provides a single service." ${ }^{3}$

QCEW data are available by state and county as well as by NAICS (North American Industry Classification, formerly SIC) industrial code. 2005 is the most recent year for which full data are publicly available. This analysis considers employment in two NAICS codes: 111, "Crop Production," and 11511, "Support Activities for Crop Production." These classifications include farms, orchards, groves, greenhouses and nurseries.

- NAWS: The NAWS "is an employment-based, random survey of the demographic and employment characteristics of the U.S. crop labor force" including information about the demographic characteristics of workers and their households, employment history, and migration patterns. ${ }^{4}$ Susan Gabbard of Aguirre International, a subsidiary of JBS International, provided special tabulations of the NAWS data for this report.

We calculated the total number of farmworkers for the state of Florida and each county by a three-step process:

1. Use the QCEW data to calculate the total number of weeks worked by workers in NAICS codes 111 and 11511. For each code and geographic area,
[^1]Total number of weeks worked =
Average weekly wage

For example, in Gadsden County in 2005, the total annual wages for NAICS code 111 were $\$ 36,701,615$. The average weekly wage for this industrial code was $\$ 374$. Dividing $\$ 36,701,615$ by $\$ 374$ yields 98,132 weeks worked in 2005 in NAICS code 111 for Gadsden County. In the same county, the total annual wages for code 11511 were $\$ 3,632,030$. The average weekly wage was $\$ 493$. Dividing $\$ 3,632,030$ by $\$ 493$ yields 7,367 weeks worked.
2. Use the NAWS data to calculate the number of workers required to work that number of weeks in one year.

The NAWS shows that farmworkers in Florida worked an average of 36 weeks during 2005. This allows us to translate the total number of weeks worked in a geographic area and NAICS code into an estimated number of workers:

Workers $=\frac{\text { Total annual weeks worked }}{\frac{\text { Average weeks worked per year }}{}=\frac{\text { Total annual weeks worked }}{}}$
In the Gadsden County example, for NAICS code 111, dividing 98,132 weeks worked by 36 weeks per worker yields 2,726 workers. For NAICS code 11511, dividing 7,367 weeks worked by 36 weeks per worker yields 204 workers.
3. Sum the total workers for the two industrial codes in each geographic area.

Total farmworkers $=$ Workers in code 111 + Workers in code 11511
For Gadsden County, total farmworkers $=2,726+204=2,930$ workers.
Unlike in past rental market studies, therefore, we used raw county-level data to distribute farmworkers among counties. In the past, we used each county's share of the state's agricultural labor expenses as reported in the USDA Census of Agriculture to distribute the state total of workers among the counties. However, the Census of Agriculture was last conducted in 2002 and does not reflect more recent changes in the industry, such as the effects of the 2004-05 hurricanes and the spread of citrus canker diseases in Florida.

Using the QCEW to distribute farmworkers among counties introduces an error into the distribution. In this report, the sum of the number of farmworkers in all counties is lower than the statewide total. This is also true for the numbers of farmworker households and household members, which are derived directly from the number of farmworkers. This disparity has two causes. First, the QCEW includes a category of employment establishments for which counties cannot be identified based on data submitted by employers. We determined that 3,768 farmworkers in Florida fall in the "County Unknown" category. For Tables 5-7, which list farmworkers, farmworker households, and farmworker household members, these farmworkers
and their associated household and household members are counted in a "County Unknown" row. However, these workers, households and household members are not included in the county lists for Tables 12-13, which identify housing need by comparing demand and supply, or in any of the maps.

Second, the Bureau of Labor Statistics suppresses wage data for establishments in some counties in order to protect confidentiality, but includes the data in statewide totals. In these counties, the number of farmworkers is actually higher than the figures reported in this report. Statewide, this results in 14,526 farmworkers (12 percent) included in the state total that are not attributed to any county or to the "County Unknown" category. To account for those workers, we redistributed the 14,526 workers among the counties and the "County Unknown" category based on the counties' share of the 103,455 workers for whom a county (or "County Unknown") designation could be identified using the QCEW and NAWS data. For example, the QCEW/NAWS method resulted in an estimate of 2,931 workers for Gadsden County, which equals 2.83 percent of 103,455 . We added 411 workers ( 14,526 * .0283) to Gadsden County's total as that county's portion of the state total that had been suppressed in the county-level data, for a total of 3,342 workers. However, this likely results in an underestimate of workers in some counties and an overestimate in others, since the wages and therefore workers at the suppressed establishments are unlikely to match the county-level distribution of wages and workers at other establishments.

Because the QCEW does list the number of establishments in a county even if the wage data for those establishments are suppressed, we can identify the counties with establishments in NAICS codes 111 and 11511 whose wages (and therefore workers) are not included in this report. While we cannot tell how many workers an establishment has, it is plausible that those counties with the most suppressed establishments are those for which the underestimates are the most acute:

Table i. Establishments with Suppressed Total Annual Wage Data for NAICS Codes 111 and 11511, 2005

| County | Number of Establishments with Suppressed Wage Data |
| :--- | ---: |
| Polk | 151 |
| Highlands | 95 |
| St. Lucie | 58 |
| Hardee | 56 |
| Lee | 55 |
| Levy | 15 |
| Okeechobee | 14 |

Source: United States Bureau of Labor Statistics, Quarterly Census of Employment and Wages, 2005.
To correct this, we recommend amending the rental market study to revise the distribution of workers by county using data from the 2007 Census of Agriculture when they become available. In the past, data from the Census of Agriculture were released two years after the census year, suggesting that this update can occur in 2009.

## Farmworker Demographic and Household Characteristics

We used data from the NAWS to identify characteristics of farmworkers and their households. Because the annual NAWS sample size is small, we used the interviews with individuals collected over a four-yeare period (fiscal years 2003-2006). Therefore, results reflect interviews with 419 individuals regarding these characteristics:

- Migrant vs. seasonal workers: The NAWS defines a "migrant" as a person traveling more than 75 miles to find farm work. "Seasonal" workers also perform labor in crop agriculture but do not make this migration.
- Accompanied vs. unaccompanied workers: Accompanied farmworkers are those living with a spouse, children, or parents, or minor farmworkers living with a sibling. Unaccompanied farmworkers are those who do not live with immediate family.
- Household size and number of farmworkers in household for accompanied workers: By definition, accompanied worker households include more than one person. They may also include more than one farmworker.
- Annual household income: We used the NAWS to determine income distributions for unaccompanied migrant worker households, unaccompanied seasonal worker households, accompanied migrant worker households and accompanied seasonal worker households. For accompanied worker households, household income may include contributions from more than one farmworker, and it may also include income from family members engaged in types of work other than agriculture.

The estimates of household income were complicated in two ways as a result of NAWS data collection practices. The NAWS survey asks farmworkers, "What was your family's total income last year in USA dollars?" (emphasis added). First, for two percent of workers surveyed, data are missing. To account for these workers, we have assumed that they would be distributed among the different income categories in proportion to each category's share of total workers. For example, if 15 percent of workers other than the missing workers reported incomes between $\$ 7,500$ and $\$ 9,999$, we added 15 percent of the missing workers to that category. Second, approximately 20 percent of workers surveyed—including 47 percent of unaccompanied migrant workers-responded that their family incomes were below $\$ 1,000$, with most of these responding that their incomes were below $\$ 500$. It is unlikely that most of these answers actually represent family incomes earned while the workers were performing farm work in Florida. More likely, these workers are new to the U.S. or to farm work and are reporting previous years' incomes that do not include farm work. Therefore, we made the assumption that these amounts did not reflect a full year's income. We redistributed these workers to the other income categories based on the other categories' share of the state total, the same method by which we redistributed the workers with missing data.

## Supply

This report tallies two sources of farmworker housing: state- and federally-assisted housing units and Department of Health-permitted camps.

First, a number of multifamily developments in the state receive state subsidies, federal subsidies, or both in order to serve low-income farmworker households. The Florida Housing Finance Corporation (Florida Housing) allocates some of its SAIL, HOME, and housing tax credit resources to multifamily developments designed to house farmworkers. In addition, a number of multifamily housing complexes receive development subsidies from the U.S. Department of Agriculture's Rural Development (RD) program to provide housing for farmworker families under the Section 514 and 516 programs. Data on properties subsidized by these programs come from the Shimberg Center’s Assisted Housing Inventory (AHI). The AHI receives data from Florida Housing and the RD program and records all units for which farmworkers are the target population. In parts of the report that evaluate the capacity of the supply to house individual farmworker household members, we assume that each multifamily unit can house four individuals.

Second, the Florida Department of Health (DOH) issues permits for camps to house unaccompanied migrant and seasonal farmworkers. These "camps" may consist of single-family homes, mobile homes, motels, multifamily units, or dormitory-style arrangements. The camps are inspected by county departments of public health, which report the camps' occupancy levels annually to DOH . We received records from DOH that include county location and occupancy for each camp. Therefore, as the figures in this report reflect a snapshot of camps’ occupancy rather than their potential capacity, it is possible that there is additional unused camp capacity available in some counties.

Seven developments were listed in both the RD/Florida Housing multifamily developments inventory and the DOH camp list. In these cases, we subtracted the developments and their bed capacity from the DOH supply figures but continued to include them in the multifamily supply. Therefore, in all tables and maps, we subtracted a total capacity of 2,573 beds from the DOH supply figure, representing three camps in Collier County, capacity 635; Miami-Dade County’s sole DOH-permitted camp, capacity 1,276; one camp in Hillsborough County, capacity 65; one camp in Palm Beach County, capacity 95; and one camp in Pasco County, capacity 502.

## II. FARMWORKER POPULATION AND HOUSEHOLD ESTIMATES

To determine the number of farmworker housing units needed and the number of people they must accommodate, this section makes estimates of the following:

- Farmworkers: individuals performing farm work in Florida or living in Florida when not migrating to other states to perform farm work.
- Farmworker households: individuals or family groups living together including at least one farmworker; many farmworker households include more than one farmworker.
- Farmworker household members: all of the individuals living in a farmworker household, regardless of whether they themselves perform farm work.

As described in the following section, farmworkers may be migrant or seasonal, with the National Agricultural Workers Survey (NAWS) defining a "migrant" as a person traveling more than 75 miles to find farm work. Seasonal workers also perform labor in crop agriculture but do not make this migration. Because migrant and seasonal workers have different household characteristics, we make separate estimates of the numbers of farmworkers, households, and household members in each of these categories.

## Total Migrant and Seasonal Farmworkers in Florida

An estimated 117,981 farmworkers worked in crop agriculture in Florida in 2005, the most recent year for which full data are available. These include greenhouse and nursery workers as well as field crop workers. This total represents a drop from the number of farmworkers in previous rental market studies. The lower number of farmworkers reflects a recent decline in citrus crop activity. The citrus industry is facing a long-term decline due to the spread of citrus canker disease in Florida, and the 2004-05 hurricanes both spread the disease and caused other, more temporary damage to citrus groves. ${ }^{5}$

In the NAWS, 46 percent of farmworkers surveyed in Florida fit the definition of migrant workers. This represents a change from the previous rental market study, which found that migrants made up the majority of workers ( 58 percent). The estimated numbers of migrant and seasonal farmworkers in the state of Florida are summarized in Table 1.

[^2]Table 1. Migrant and Seasonal Workers in Florida, 2005

| Migrant Workers | Seasonal Workers | Total |
| :---: | :---: | :---: |
|  | 54,271 | 63,710 |

Sources: United States Bureau of Labor Statistics, Quarterly Census of Employment and Wages, 2005 and United
States Department of Labor, National Agricultural Workers Survey, 2003-2006.

## Accompanied vs. Unaccompanied Farmworkers

In addition to the migrant/seasonal distinction, farmworkers may be accompanied or unaccompanied. Accompanied farmworkers are those living with a spouse, children, or parents, or minor farmworkers living with a sibling. Unaccompanied farmworkers are those who do not live with immediate family. According to the NAWS, a small number of migrant farmworkers (13 percent) and a much larger portion of seasonal farmworkers (53 percent) in Florida are accompanied by immediate family. Applying these percentages to the estimate of total farmworkers yields the estimates for Florida as listed in Table 2.

Table 2. Unaccompanied and Accompanied Farmworkers in Florida, 2005

|  | Unaccompanied Workers | Accompanied Workers |
| :--- | ---: | ---: |
| Migrant | 47,216 | 7,055 |
| Seasonal | 29,944 | 33,766 |
| TOTAL | 77,159 | 40,822 |

Sources: United States Bureau of Labor Statistics, Quarterly Census of Employment and Wages, 2005 and United States Department of Labor, National Agricultural Workers Survey, 2003-2006.

An analysis of farmworker housing needs must also take into account the needs of family members living with the farmworker. According to the NAWS, the average household size is 3.07 members for accompanied migrant workers and 3.71 members for accompanied seasonal workers. Moreover, a household may contain more than one farmworker. The NAWS found that an average of 1.82 farmworkers lived in each household containing accompanied migrant workers and an average of 1.39 farmworkers lived in each household containing accompanied seasonal workers. Table 3 displays the estimated numbers of accompanied farmworker households and household members.

Table 3. Accompanied Farmworkers and Their Households in Florida, 2005

|  | Accompanied <br> Workers | Households (Workers/Average <br> Workers per Household) | Household Members (Households <br> * Average Members per <br> Household) |
| :--- | ---: | ---: | ---: |
| Migrant | 7,055 | 3,877 | 11,901 |
| Seasonal | 33,766 | 24,292 | 90,124 |
| TOTAL | 40,822 | 28,169 | 102,025 |

Sources: United States Bureau of Labor Statistics, Quarterly Census of Employment and Wages, 2005 and United States Department of Labor, National Agricultural Workers Survey, 2003-2006.

Since unaccompanied workers do not have other members of their immediate families living with them, each worker forms a household of one. Thus, the number of unaccompanied worker households equals the number of unaccompanied workers. Combining the number of unaccompanied workers in Table 2 and the numbers of accompanied worker households and household members in Table 3 yields the total number of farmworker households and household members in Florida in Table 4.

Table 4. Farmworker Households and Household Members in Florida, 2005

|  | Unaccompanied <br> Worker <br> Households | Accompanied <br> Worker <br> Households | Total <br> Households | Unaccompanied <br> Worker <br> Household <br> Members | Accompanied <br> Worker <br> Household <br> Members | Total <br> Household <br> Members |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Migrant | 47,216 | 3,877 | 51,092 | 47,216 | 11,901 | 59,117 |
| Seasonal | 29,944 | 24,292 | 54,236 | 29,944 | 90,124 | 120,068 |
| TOTAL | 77,159 | 28,169 | 105,328 | 77,159 | 102,025 | 179,185 |

Sources: United States Bureau of Labor Statistics, Quarterly Census of Employment and Wages, 2005 and United States Department of Labor, National Agricultural Workers Survey, 2003-2006.

In sum, Florida has 105,328 farmworker households with 179,185 household members.

## Estimating Farmworker Population, Households, and Household Members by County

Table 5 shows the numbers of unaccompanied migrant and seasonal workers by county. As noted above, these also represent the number of unaccompanied households and household members, since each unaccompanied worker forms a household of one. Table 6 shows the number of accompanied workers, accompanied worker households, and accompanied worker household members for migrant and seasonal workers by county. Table 7 shows the total numbers of farmworkers, farmworker households, and farmworker household members by county, regardless of migrant/seasonal status. Figure 1 is a map showing the distribution of all farmworkers by county. See Appendix 1 for a reference map with Florida county names.

The counties with more than 2,500 farmworkers are Hillsborough, Miami-Dade, Palm Beach, Collier, Manatee, Orange, Hendry, Volusia, Indian River, Gadsden, Lake, Polk, and De Soto. These counties combined contain 81 percent of the state's farmworkers.

Table 5. Unaccompanied Farmworkers by County, 2005

| County | Unaccompanied Migrant Workers | Unaccompanied Seasonal Workers | Total Unaccompanied Workers |

## III. INCOMES AND AFFORDABLE RENT RANGES FOR FARMWORKER HOUSEHOLDS

We used NAWS data to estimate the breakdown of farmworker households by family income range to determine how much the households can afford to pay in rent. In general, unaccompanied farmworker households tend to have lower incomes than accompanied farmworker households. Accompanied farmworkers may have several workers living in their households and earning farm income, or they may have family members contributing income from other types of work.

Even with the workers reporting incomes below $\$ 1,000$ redistributed to other categories (see "Methodology"), unaccompanied migrant farmworkers fall most frequently into the lowest income groups, with 77 percent earning less than $\$ 10,000$ per year and only four percent with incomes of $\$ 25,000$ or greater. Unaccompanied seasonal workers have somewhat higher incomes, with 75 percent earning $\$ 10,000-25,000$ per year and an additional nine percent earning more than $\$ 25,000$ per year. Table 8 below shows the distribution of unaccompanied migrant and seasonal workers within income ranges. Assuming that households can pay no more than 40 percent of gross income for rent, Table 8 also shows the rent that would be considered "affordable" for each income range. ${ }^{6}$

Table 8. Incomes and Affordable Rents for Unaccompanied Farmworkers, 2005

| Annual Family Income | Affordable Monthly Rent Range | Unaccompanied Migrant Worker Households | Unaccompanied Seasonal Worker Households | Total Unaccompanied Worker Households |
| :---: | :---: | :---: | :---: | :---: |
| \$1,000 to \$2,499 | \$33 to \$83 | 3,744 | 12 | 3,756 |
| \$2,500 to \$4,999 | \$84 to \$167 | 6,067 | 450 | 6,517 |
| \$5,000 to \$7,499 | \$168 to \$250 | 13,024 | 1,273 | 14,297 |
| \$7,500 to \$9,999 | \$251 to \$333 | 13,278 | 3,158 | 16,437 |
| \$10,000 to \$12,499 | \$334 to \$417 | 6,131 | 3,793 | 9,924 |
| \$12,500 to \$14,999 | \$418 to \$500 | 1,843 | 7,348 | 9,190 |
| \$15,000 to \$17,499 | \$501 to \$583 | 349 | 6,472 | 6,821 |
| \$17,500 to \$19,999 | \$584 to \$667 | 28 | 1,973 | 2,001 |
| \$20,000 to \$24,999 | \$668 to \$833 | 282 | 3,077 | 3,359 |
| \$25,000 to \$29,999 | \$834 to \$1,000 | 0 | 1,504 | 1,504 |
| \$30,000 to \$34,999 | \$1,001 to \$1,167 | 1,899 | 150 | 2,049 |
| \$35,000 to \$39,999 | \$1,168 to \$1,333 | 0 | 182 | 182 |
| Over \$40,000 | \$1,334 and above | 0 | 891 | 891 |
| Total Households |  | 46,646 | 30,282 | 76,928 |

Sources: United States Bureau of Labor Statistics, Quarterly Census of Employment and Wages, 2005 and United States Department of Labor, National Agricultural Workers Survey, 2003-2006.

[^3]Accompanied migrant worker households generally have lower incomes than accompanied seasonal worker households, with 26 percent earning less than $\$ 10,000$ per year, 58 percent earning $\$ 10,000-25,0000$ per year, and only 15 percent earning $\$ 25,000$ per year or more. Among accompanied seasonal worker households, only 7 percent earn less than $\$ 10,000$ per year, 54 percent earn $\$ 10,000-25,000$ per year, and 38 percent earn $\$ 25,000$ per year or more.

Table 9 shows the income distribution and affordable rents for accompanied farmworker households. Note that we extrapolated from the number of accompanied workers to the number of households by dividing the number of workers in each category by the overall average number of accompanied workers per household (1.82 workers for migrant households, 1.39 workers for seasonal worker households). In fact, however, it is likely that some households with higher incomes contain more farmworkers than those with lower incomes, since households can aggregate the income of several workers to reach a higher income level. Therefore, these numbers likely underestimate the number of accompanied worker households in the lowest income ranges and overestimate the number of households in the highest income ranges. However, it is impossible to estimate the extent to which higher-income households contain more farmworkers, in part because accompanied farmworker households with higher family incomes may derive some of that income from family members in occupations other than farm work.

Table 9. Incomes and Affordable Rents for Accompanied Farmworker Households, 2005

| Annual Family <br> Income | Affordable Monthly <br> Rent Range | Accompanied Migrant <br> Worker Households | Accompanied Seasonal <br> Worker Households | Total Accompanied <br> Worker Households |
| :--- | :--- | ---: | ---: | ---: |
| $\$ 1,000$ to $\$ 2,499$ | $\$ 33$ to $\$ 83$ | 0 | 68 | 68 |

Sources: United States Bureau of Labor Statistics, Quarterly Census of Employment and Wages, 2005 and United States Department of Labor, National Agricultural Workers Survey, 2003-2006.

These income and rent ranges show that about half of unaccompanied farmworkers need single-person units or beds with rents below $\$ 333$ per month, with an additional 25 percent needing units with rents below $\$ 500$ per month. Many accompanied farmworker families also need housing units with rents well below the market rate, with more than one-third requiring
units with rents of $\$ 500$ per month or less. However, half of accompanied farmworker families may be able to afford rents closer to market rates; i.e., in the $\$ 668$ and above range.

Table 10 and Figure 2 below show the percentages of unaccompanied and accompanied farmworker households that are able to afford rents at various levels. Again, note that these numbers likely underestimate the number of accompanied worker households in need of housing in the lowest rent ranges and overestimate the number that can afford housing at higher rents.

Table 10. Percentages of Unaccompanied and Accompanied Farmworker Households by Affordable Rent Range, 2005

| Affordable Monthly Rent Range | Unaccompanied Worker Households | Accompanied Worker <br> Households |
| :--- | ---: | ---: |
| Up to $\$ 167$ | $13 \%$ | $4 \%$ |

## IV. FARMWORKER HOUSING SUPPLY

While farmworkers may find a variety of types of housing arrangements, two types of government-licensed or subsidized housing are reserved specifically for farmworkers:

- State- and federally-subsidized multifamily housing: The Florida Housing Finance Corporation (Florida Housing) allocates some of its SAIL, HOME, and housing tax credit resources to multifamily developments designed to house farmworkers. In addition, a number of multifamily housing complexes receive development subsidies from the U.S. Department of Agriculture's Rural Development (RD) program to provide housing for farmworker families under the Section 514 and 516 programs. Presently, there are 6,401 farmworker units with these types of financing in operation or under development.
- Department of Health-permitted camps: The Florida Department of Health (DOH) issues permits for camps to house unaccompanied migrant and seasonal farmworkers. The current occupancy of DOH-permitted camps is 30,164 beds. This represents a drop of more than 5,000 beds since the previous rental market study. Like the drop in the number of farmworkers, the reduction in the occupancy appears to be caused by reduced citrus crop activity due to the 2004-05 hurricanes, and long-term damage from the spread of citrus canker disease. ${ }^{7}$

Of the DOH-permitted beds, 2,573 are located in RD or Florida Housing multifamily developments. Therefore, the DOH camps add 27,591 unduplicated beds to the supply. The tables and maps below reflect this unduplicated capacity.

Assuming that the Section 514/516 units and Florida Housing-assisted units can house an average of four persons, the farmworker housing supply can house a total of 53,195 farmworkers and their family members in Florida.

Table 11 lists the supply of these two types of farmworker housing by Florida county. The term "capacity" in this table and the following map refers to the number of individual farmworkers and their household members who can be housed. The term "unit" in this and later tables refers to an apartment in a Section 514/516 or Florida Housing development. A single unit may have the capacity to house several farmworkers and family members. Figure 3 maps the total capacity of beds for farmworkers and their family members by county. See Appendix 1 for a reference map with Florida county names.

Figure 3. Farmworker Housing Capacity by County, 2005

Sources: Florida Department of Health, 2007 and Shimberg Center for Affordable Housing, Affordable Housing Inventory, 2007.

The 11 counties with the capacity to house 1,000 or more farmworkers are Collier, Palm Beach, Miami-Dade, Hillsborough, Hendry, De Soto, Manatee, Polk, Indian River, Highlands, and Gadsden. These counties contain 84 percent of the state's farmworker housing capacity.

In most cases, the counties with the most farmworker housing supply also have the most farmworkers. Collier, Miami-Dade, Palm Beach, Hillsborough, Hendry, DeSoto, Manatee, Polk, Indian River, and Gadsden Counties appear on the lists of counties with highest number of farmworkers and the largest farmworker housing capacity. There are, however, some disparities between the lists: Orange County ranks sixth in the number of farmworkers, Volusia County ranks eighth, and Lake County ranks eleventh, but these counties have housing capacity below 1,000. Conversely, Highlands County ranks tenth in housing capacity but falls just short of the list of counties with the most farmworkers, ranking fifteenth in the number of workers.

It is important to note that many farmworkers meet their housing needs through the private market or through subsidized housing not specifically reserved for farmworkers. Thus, the supply described in this section does not represent the full extent of affordable housing that might be available to farmworkers. When compared with the number of farmworker households and household members, as in the following section, this constrained definition of supply yields a higher need for farmworker housing than what a true accounting of the full supply of housing available to farmworkers would yield.

## V. Need Estimate: Comparison of Supply and Households

The following estimate sof the need for additional farmworker housing in Florida compare the supply of farmworker housing in each county to the number of farmworker households and household members. Table 12 estimates the need for total capacity- the number of individuals who need farmworker housing in each county-by comparing the capacity of DOH-permitted camps, Section 514/516 housing, and Florida Housing-assisted farmworker housing to the number of farmworkers and household members. Note that each Section 514/516 and Florida Housing-assisted unit adds a capacity of four to the supply.

Table 13 estimates the need for beds for single farmworkers and housing units for families by comparing the number of DOH-permitted units to the number of unaccompanied farmworkers and the number of multifamily Section 514/516 and Florida Housing-assisted units to the number of accompanied farmworker households. In this table, a single unit is counted once rather than as a capacity of four. Figures 4 and 5 are maps showing the need for beds for unaccompanied farmworkers and for multifamily units by county. See Appendix 1 for a reference map with Florida county names.

While we have compared the number of unaccompanied farmworkers to the number of DOH-permitted camp beds in Table 13, it is important to note that groups of unaccompanied farmworkers also may share units in state- and federally-subsidized multifamily developments. Therefore, some of the Florida Housing and Section 514/516 units that we have assigned to accompanied farmworker households may serve unaccompanied workers. Moreover, because unaccompanied workers may share housing, the numbers of beds needed for them do not necessarily translate to the number of individual units needed. Multifamily units may provide several beds; for example, a two-bedroom unit may provide four beds for unaccompanied farmworkers. Finally, note that any developments appearing in both the Florida Housing/RD multifamily list and the DOH camp list will be reflected in the multifamily category only.

Analysis of the numbers in Table 12 and 13 reveals that the total statewide gap between farmworker housing capacity and the number of farmworkers and their household members is 125,989 beds. The total gap between the number of single worker beds needed and the number of unaccompanied farmworkers is 49,568 beds. Eleven counties have an unmet need for single worker housing exceeding 1,000 beds: Miami-Dade, Hillsborough, Palm Beach, Orange, Manatee, Volusia, Gadsden, Hendry, Indian River, Lake, and Lee. The total gap between the number of multifamily units and the number of accompanied farmworker households is 21,768 units. The seven counties with unmet need for multifamily farmworker units exceeding 1,000 units are Hillsborough, Palm Beach, Miami-Dade, Manatee, Orange, Collier, and Hendry.

## VI. DATA LIMITATIONS

The numbers of farmworkers and housing units and the income numbers on which the analysis in this report is based should be used with caution due to several data limitations. First, as noted in the Methodology section, the method of using QCEW data on wages to estimate the number of farmworkers results in only 85 percent of farmworkers being assigned to specific counties. An additional three percent are designated as "County Unknown," and the remaining 12 percent are distributed among counties based on those counties' share of the 85 percent of workers already allocated. This will result in overestimates of workers in some counties, particularly those with the largest number of farmworkers, and underestimates of workers in some of the counties with fewer workers. As stated in the Methodology section, we recommend revising the distribution of farmworkers among counties when 2007 Census of Agriculture data become available.

Second, the sample of workers questioned for the NAWS survey is small and may underrepresent people working on Florida citrus farms. Thus, the division between migrant and seasonal workers, the division between accompanied and unaccompanied workers, and the income numbers are subject to error.

Third, as noted in Section II, the lack of family income data by household led us to extrapolate the number of households in each income range from the number of workers in that range. This may have led to an overestimate of accompanied worker households at the higher income levels and an underestimate of accompanied worker households at the lower income levels.

Finally, as noted in Section III, the count of housing units for farmworkers and their families does not include farmworker housing that might be provided by the private market or local entities, other than those licensed as camps by the state. In some cases, the camps themselves may be able to house more workers, since the capacity recorded by DOH reflects point-in-time occupancy levels. Therefore, while the supply numbers do accurately reflect the stock of state- and federally-subsidized multifamily units reserved for farmworkers and likely account for the vast majority of beds in DOH camps, they do not reflect all of the housing choices that may available to farmworkers.

## ACKNOWLEDGMENTS

Anne Ray of the Shimberg Center for Affordable Housing prepared the text for this report. Douglas White prepared the maps, and Diep Nguyen compiled data on the multifamily housing supply.

Susan Gabbard of JBS International provided the estimates of total farmworkers in Florida and their breakdown by migrant/seasonal, accompanied/unaccompanied, and income categories. Sharon Saulter of the Florida Department of Health provided information about DOH-permitted camps.

Robert Emerson of the Institute of Food and Agricultural Sciences at University of Florida and Robert Williams of the Florida Legal Services Migrant Farmworker Justice Project reviewed estimates of farmworkers in Florida counties.

[^0]:    ${ }^{1}$ The farmworker total includes workers in firms classified by the NAICS (North American Industry Classification, formerly SIC) in codes 111, "Crop Production," and 11511, "Support Activities for Crop Production." These classifications include farms, orchards, groves, greenhouses and nurseries.
